ST-100 for Cleanup of Oily Steam Condensate in Industrial Plants

Any industrial plant which uses steam driven equipment, or which relies in some other way on oily materials, ends up with an environmental liability in that it cannot discharge oily steam condensate, such as in a petrochemical plant, or otherwise oily water, water containing emulsified oil and grease, into the environment. Recycling the polluted steam condensate fouls the boiler heating surfaces. ST-100, when placed into an appropriate filter, removes the oil, as shown below.
